EXP: 1 INTRODUCTION TO NUMPY FOR DATA ANALYSIS

AIM :

A collage wantes to analyze the mark for Student in 4 subjects using numpy

Given:

Student	maths	physics	chemistry	English
S_1	85	78	92	88
S_2	76	81	85	79
S_3	90	95	89	93
S_4	65	72	70	68
S_5	88	84	91	90

a) Display the marks for all student

```
print ("Marks of all Student: \n", marks)
```

b) Arg properties

```
print ("Shape ", marks.shape)
print ("Dimension , marks.ndim)
print(" Size :", marks.size)
print ( "Data type", marks.dtype)
```

c) Specific Selections

```
print("Marks of Students 3:", mark[2])
print("Chemistry marks", mark[:,2])
print (" Student 5 English:", marks[4,3])
```

d) Student total and average

```
total_marks = marks.sum(axis=1)
total_marks = marks.sum(axis=1)

print (" Total marks per Student %:" total marks)
print (" Average marks per Student:", average_marks)
```

c) Subject average

```
Subject = marks.mean(axis=0)
Print("Average marks per subject :", Subject avg)
```

RESULT :

The above code is executed and desired output is obtained.
